

## Uses of Computer

A computer is an electronic device that executes certain actions through user-based commands. It is made up of two parts - hardware and software. The computer processes input through input devices like the **mouse** and **keyboard**. The computer displays output through output devices like a **monitor** and **printer**. The size of a computer varies considerably from small personal computers (like laptops, minicomputers, and notebook laptops), to gigantic supercomputers which require an entire building to host them. The speed also has a very large range. Computers have become indispensable in today's world; let's take a look at why we're so dependable on them.

- Scientific research
- Business Applications
- Payroll and personal records
- Office Automation
- Word Processing
- Desktop Publishing
- Electronic office
- Stock control and sales
- Banking
- Air travel
- Rail/bus transportation
- Education
- Super markets
- Libraries
