

# 11 CONSTRUCTIONS

## EXERCISE 11.2

**Q.1.** Construct a triangle  $ABC$  in which  $BC = 7$  cm,  $\angle B = 75^\circ$  and  $AB + AC = 13$  cm.

### Steps of Construction

- Draw a line segment  $BC = 7$  cm.
- At  $B$ , draw  $\angle CBX = 75^\circ$ .
- Cut a line segment  $BD = 13$  cm from  $BX$ .
- Join  $DC$
- Draw the perpendicular bisector  $LM$  of  $CD$ , which intersects  $BD$  at  $A$ .
- Join  $AC$ . Then  $ABC$  is the required triangle.

**Justification :** In  $\triangle ACD$ , we have

$$AC = AD \quad [A \text{ lies on the perpendicular bisector of } DC.]$$

$$AB = BD - AD$$

$$= BD - AC$$

$$\Rightarrow AB + AC = BD$$

**Q.2.** Construct a triangle  $ABC$ , in which  $BC = 8$  cm,  $\angle B = 45^\circ$  and  $AB - AC = 3.5$  cm.

### Steps of Construction

- Draw a line segment  $BC = 3.5$  cm
- At  $B$ , draw  $\angle CBX = 45^\circ$ .
- From  $BX$ , cut off  $BD = 3.5$  cm.
- Join  $DC$ .
- Draw the perpendicular bisector  $LM$  of  $DC$ , which intersects  $BX$  at  $A$ .
- Join  $AC$ . Then  $ABC$  is the required triangle.

**Justification :** In  $\triangle ADC$ ,

$$AD = AC \quad [A \text{ lies on the perpendicular bisector of } DC]$$

$$BD = AB - AD$$

$$\Rightarrow BD = AB - AC$$

**Q.3.** Construct a triangle  $PQR$  in which  $QR = 6$  cm,  $\angle Q = 60^\circ$  and  $PR - PQ = 2$  cm.

### Steps of Construction

- Draw a line segment  $QR = 6$  cm
- At  $Q$ , draw  $\angle RQX = 60^\circ$ .

- (iii) Produce XQ to Y.
- (iv) Cut off QS = 2 cm from QY.
- (v) Join SR.
- (vi) Draw the perpendicular bisector LM of SR, which intersect QX at P.
- (vii) Join PR. Then PQR is the required triangle.

**Justification :** In  $\Delta PSR$ , we have

$$SP = PR \quad [P \text{ lies on the perpendicular bisector of } SR]$$

$$\begin{aligned} QS &= PS - PQ \\ &= PR - PQ \end{aligned}$$

**Q.4.** Construct a  $\Delta XYZ$  in which  $\angle X = 30^\circ$ ,  $\angle Z = 90^\circ$  and  $XY + YZ + ZX = 11$  cm.

**Steps of Construction**

- (i) Draw a line segment AB = 11 cm
- (ii) At A, draw  $\angle BAP = 30^\circ$  and at B, draw  $\angle ABR = 90^\circ$
- (iii) Draw the bisector of  $\angle BAP$  and  $\angle ABR$ , which intersect each other at Y.
- (iv) Join AY and BY.
- (v) Draw the perpendicular bisectors LM and ST of AY and BY respectively. LM and ST intersect AB at X and Z respectively.
- (vi) Join XY and YZ. Then XYZ is the required triangle.

**Justification :** In  $\Delta AXY$ , we have

$$AX = XY \quad [X \text{ lies on the perpendicular bisector of } AY] \dots (i)$$

$$\text{Similarly, } ZB = YZ \dots (ii)$$

$$\therefore XY + YZ + ZX = AX + ZB + ZX \quad [\text{From (i) and (ii)}]$$

$$= AB$$

$$\text{From (i), } AX = XY$$

$$\Rightarrow \angle XAY = \angle XYA \quad [\text{Angles opposite to equal sides are equal}] \dots (iii)$$

$$\text{In } \Delta AXY, \angle YXZ = \angle XAY + \angle XYA \quad [\text{Exterior angle is equal to sum of interior opposite angles}]$$

$$\Rightarrow \angle YXZ = 2\angle XAY \quad [\text{From (iii)}]$$

$$\Rightarrow \angle YXZ = \angle XAP \quad [\because AY \text{ bisects } \angle XAP]$$

$$\text{Similarly, } \angle YZX = \angle ZBR.$$

**Q.5.** Construct a right triangle whose base is 12 cm and sum of its hypotenuse and other side is 18 cm.

**Steps of Construction**

- (i) Draw a line segment AB = 12 cm.
- (ii) At A, draw  $\angle BAX = 90^\circ$ .
- (iii) From AX, cut off AD = 18 cm.
- (iv) Join DB.
- (v) Draw the perpendicular bisector LM of BD, which intersects AD at C.
- (vi) Join BC. Then  $\Delta ABC$  is the required triangle.
