

Server Units

There are compact, easy-to-manage servers now available that come with networking hardware and software already installed. These servers are commonly referred to as server units and are most often used as Web servers. Server units can include an operating system, application software, server management software and services, such as an e-mail service. They usually include hardware components such as large storage devices and network interface cards. Cobalt Networks, Inc. is a popular manufacturer of server units.
