# **Presentation of Data**

### **Multiple Choice Type Questions**

- 1. Bar diagram is a
  - a. one-dimensional diagram
  - b. two-dimensional diagram
  - c. diagram with no dimension
  - d. None of these.
- 2. Data represented through a histogram can help in finding graphically the
  - a. mean
  - b. mode
  - c. median
  - d. All of these
- 3. Ogives can be helpful in locating graphically the
  - a. mode
  - b. mean
  - c. median
  - d. None of these
- 4. Data represented through arithmetic line graph help in understanding
  - a. long term trend
  - b. cyclicity in data
  - c. seasonality in data
  - d. All of the above
- 5. The series in which lower limit of the class interval or the upper limit of last class interval is missing
  - a. Cumulative frequency
  - b. Exclusive
  - c. open-end series
  - d. Frequency array

## **ANSWER**

1. (a) 2. (b) 3. (c) 4. (a) 5. (c)

### **SHORT ANSWER QUESTIONS**

1. What are the two principal parts of a table?

Answer: The two principal parts of a table are: (i) Table number (ii) Title

2. How can tables be classified?

Answer: Tables can be classified into three parts: (i) Purpose (ii) Originality (iii) Construction

3. What are the two types of a complex table?

Answer: The two types of a complex table are: (i) Double or two-way table (ii) Manifold table

4. What are the different forms of presentation of data?

<u>Answer</u>: The different forms of presentation of data are: (i) Textual and descriptive presentation (ii) Tabular presentation (iii) Diagrammatic presentation

### LONG ANSWER QUESTION

- 1. What kind of diagrams are more effective in representing the following?
  - (a) Monthly rainfall in a year
  - (b) Composition of the population of Delhi by religion
  - (c) Components of cost in a factory

#### Answer:

(a) The monthly rainfall in a year can be best represented by a bar diagram as only one variable i.e., monthly rainfall is to be presented diagrammatically. The rainfall is plotted on Y-axis in the corresponding month that is plotted on the X-axis.

(b) Composition of the population of Delhi by religion can be represented by a component bar diagram. A component bar diagram shows the bar and its sub-divisions into two or more components. Thus, the total population can be sub divided in terms of religion and presented through a component bar diagram.

(c) Different components of cost in a factory can most effectively be depicted through a pie chart. The circle represents the total cost and various components of costs are shown by different portions of the circle drawn according to percentage of total cost each component covers.

 Suppose you want to emphasise the increase in the share of urban non-workers and lower level of urbanisation in India as shown in Example 4.2. How would you do it in the tabular form?
 <u>Answer:</u> Share of urban workers and non workers in India

	Location			
Sex	Worker in urban (in crore)	Non-worker in urban (in crore)	Total	
Male	50	70	120	
Femal	25	50	75	
Total	75	120	195	

How does the procedure of drawing a histogram differ when class intervals are unequal in comparison to equal class intervals in a frequency table?
 <u>Answer:</u> A histogram is a set of rectangles with bases as the intervals between class boundaries (along X-axis) and with areas proportional to the class frequency. If the class intervals are of equal width, the area of the rectangles are proportional to their respective frequencies.

However, sometimes it is convenient or at times necessary, to use varying width of class intervals. For graphical representation of such data, height for area of a rectangle is the quotient of height i.e., frequency and base i.e., width of the class interval. When intervals are equal, all rectangles have the same base and area can conveniently be represented by the frequency of the interval.

But, when bases vary in their width, the heights of rectangles are to be adjusted to yield comparable measurements by dividing class frequency by width of the class interval instead of absolute frequency. This gives us the frequency density for the purpose of comparison.

4. The Indian Sugar Mills Association reported that, 'sugar production during the first fortnight of December, 2001 was about 3,87,000 tonnes, as against 3,78,000 tonnes during the same fortnight last year (2000). The off-take of sugar from factories during the first fortnight of December, 2001 was 2,83,000 tonnes for internal consumption and 41,000 tonnes for exports as against 1,54,000 tonnes for internal consumption and nil for exports during the same fortnight last season.'
(i) Present the data in tabular form

(i) Present the data in tabular form.

(ii) Suppose you were to present these data in diagrammatic form which of the diagrams would you use and why?

(iii) Present these data diagrammatically.

#### Answer:

(i) Data in tabular form. Sugar Production in India

	Total Production (tonnes)	Off-take for Internal Consumption (tonnes)	Off-take for Exports (tonnes)
December 2000	378000	154000	_
December 2001	387000	283000	41000

(ii) The data can effectively be presented diagrammatically using the multiple bar diagram. This is because multiple bar diagrams are used for comparing two or more sets of data for different years or

5. The following table shows the estimated sectoral real growth rates (percentage change over the previous year) in GDP at factor cost.

Year (1)	Agriculture and allied sectors (2)	Industry (3)	Services (4)
1994-95	5.0	9.2	7.0
1995-96	-0.9	11.8	10.3
1996-97	9.6	6.0	7.1
1997-98	- 1.9	5.9	9.0
1998-99	7.2	4.0	8.3
1999-2000	0.8	6.9	8.2

Represent the data as multiple time-series graphs. Answer:
