Comprehension # 3

If length of perpendicular drawn from points of a curve to a straight line approaches zero along an infinite branch of the curve, the line is said to be an asymptote to the curve. For example, y -axis is an asymptote to $y = nx$ & x -axis is an asymptote to $y = e^{-x}$.

Asymptotes parallel to x -axis :

If $\lim_{x \rightarrow \infty} f(x) = \alpha$ (a finite number) then $y = \alpha$ is an asymptote to $y = f(x)$. Similarly if $\lim_{x \rightarrow -\infty} f(x) = \alpha$, then $y = \alpha$ is also an asymptote.

Asymptotes parallel to y-axis :

If $\lim_{x \rightarrow a} f(x) = \infty$ or $\lim_{x \rightarrow a} f(x) = -\infty$, then $x = a$ is an asymptote to $y = f(x)$.
