<u>SOLUTIONS</u>

ANSWER-1

To create hyperlinks, or links that connect to another web page, use the href tag. The general format for this is: text
Replace "site" with the actual page URL that is supposed to be linked to when the text is clicked.

ANSWER-2

No. The <a> tag can accept only a single href attribute, and it can point to only a single web page.

ANSWER-3

The key difference is that the directory and menu lists do not include attributes for changing the bullet style.

ANSWER-4

Any <tr> tag can be changed to a <th> tag. This causes the text contained within the <th> tag to be displayed as bold in the browser. Although <th> tags are mainly used for headings, they do not need to be used exclusively for headings.

ANSWER-5

No. The <br> tag is only one way to separate lines of text. Other tags, like the <p> tag and <blockquote> tag, also separate sections of text.

ANSWER-6

The default color for normal and active links is blue. Some browsers recognize an active link when the mouse cursor is placed over that link; others recognize active links when the link has the focus. Those that don't have a mouse cursor over that link is considered a normal link.

ANSWER-7

<Video> and <Audio> are new tags which are included in HTML5 version. They are mainly used as a replacement for Flash, Silverlight, and similar technologies to play multimedia items.

ANSWER-8

The <article> and <section> tags are two new tags that are included in HTML5. Articles can be composed of multiple sections that can have multiple articles. An article tag represents a full block of content which is a section of a bigger whole.

ANSWER-9

This tag represents a piece of self-contained flow content. It is mostly used as a single unit as a reference the main flow of the document.

ANSWER-10

The browser sizes the frames relative to the total sum of the values. If the cols attribute is set to 100%, 200% the browser displays two vertical frames with the second being twice as big as the first.
