PRINCIPLE OF MATHEMATICAL INDUCTION

PRINCIPLE OF M.I AND EXAMPLE

PRINCIPLE OF MATHEMATICAL INDUCTION

Theorem-I

If P(n) is a statement depending upon n, then to prove P(n) by induction, we proceed as follows :

(i) Verify the validity of P(n) for $n = 1$

(ii) Assume that P(n) is true for any positive integer m and then using it establish the validity of P(n) for
$n = m + 1$.
Then P(n) is true for each $n \in N$

Theorem-II

If P(n) is a statement depending upon n but beginning with any positive integer k, then to prove P(n) by Induction, we proceed as follows :

(i) Verify the validity of P(n) for $n = k$.

(ii) Assume that the P(n) is true for $n = m \geq k$.
Then using it establish the validity of P(n) for $n = m + 1$.
Then P(n) is true for each $n \geq k$

SOME USEFUL RESULT BASED ON PRINCIPLE OF MATHEMATICAL INDUCTION

For any natural number n

(i) $1 + 2 + 3 + ... + n = Sn = \frac{n(n+1)}{2}$

(ii) $1^2 + 2^2 + 3^2 + ... + n^2 = Sn^2 = = \frac{n(n+1)(2n+1)}{6}$

(iii) $1^3 + 2^3 + 3^3 + ... + n^3 = Sn^3 = (Sn)^2 = = \left\{\frac{n(n+1)}{2}\right\}^2$

(iv) $2 + 4 + 6 + ... + 2n = \Sigma 2n = n(n + 1)$

(v) $1 + 3 + 5 + ... + (2n - 1) = \Sigma(2n - 1) = n^2$

(vi) $x^n - y^n = (x - y)(x^{n-1} + x^{n-2}y + x^{n-3}y^2 + ... + xy^{n-2} + y^{n-1})$

(vii) $x^n + y^n = (x + y)(x^{n-1} - x^{n-2}y + x^{n-3}y^2 + ... - xy^{n-2} + y^{n-1})$
when n is odd positive integer

NOTE:

(i) Product of r successive integers is divisible by r!

(ii) For $x \neq y$, $x^n - y^n$ is divisible by
(a) $x + y$, if n is even (b) $x - y$, if n is even or odd

(iii) $x^n + y^n$ is divisible by $x + y$, If n is odd

(iv) For solving objective question related to natural numbers we find out the correct alternative by negative examination of this principle. If the given statement is P(n), then by putting n = 1, 2, 3 .... in P(n) we decide the correct answer. We also use the above formulae established by this principle to find the sum of n terms of a given series. For this we first express T_n as a polynomial in n and then for finding S_n, we put Σ before each term of this polynomial and then use above results of Σn, Σn^2, Σn^3 etc.

(v) If a given statement P(n) is to be proved for n = m + 1, m + 2, m + 3............ for some $m \in N$, then we are required to prove that P(m + 1) is true instead of proving P(1) is true.

Ex.1 Find the sum of the terms in the n^{th} bracket of the series
$(1) + (2 + 3 + 4) + (5 + 6 + 7 + 8 + 9) + ...$

Sol. For n = 1, we have
Sum of the terms in first bracket = 1
and, $(n - 1)^3 + n^3 = (1 - 1)^3 + 1^3 = 1$
for n = 2, we have
Sum of the terms in the second bracket = 2 + 3 + 4 = 9

and, $(n-1)^3 + n^3 = (2-1)^3 + 2^3 = 1 + 8 = 9$

Ex.2 By using P.M.I. prove that $10^n + 3.4^{n+2} + 5$ is divisible by 9, $n \in N$.

Sol. Given statement is true for n = 1 as 10 + 192 + 5 = 207 is divisible by 9.

Let us assume that the result is true for n = k

i.e. $10^k + 3.4^{k+2} + 5 = 9l,\ l \in N$.

Now for n = k + 1

$10^{k+1} + 3.4^{k+3} + 5 = 10(9l - 3.4^{k+2} - 5) + 3.4^{k+3} + 5$

$= 90l - 288.4^k - 45$

which is divisible by 9. so the result is true for n = k + 1

so by P.M.I. the result is true for all $n \in N$.

Ex.3 If $A = \begin{pmatrix} 1 & k \\ 0 & 1 \end{pmatrix}$, then for some $n \in N$, find A^n.

Sol. We find that

$$A^2 = \begin{pmatrix} 1 & k \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 1 & k \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 2k \\ 0 & 1 \end{pmatrix}$$

$$A^3 = \begin{pmatrix} 1 & 2k \\ 0 & 1 \end{pmatrix}\begin{pmatrix} 1 & k \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 3k \\ 0 & 1 \end{pmatrix}$$

Similarly

$$A^4 = \begin{pmatrix} 1 & 4k \\ 0 & 1 \end{pmatrix}, A^s = \begin{pmatrix} 1 & 5k \\ 0 & 1 \end{pmatrix} \text{ etc.}$$

$$\text{So} \quad A^n = \begin{pmatrix} 1 & nk \\ 0 & 1 \end{pmatrix}$$

Ex.4 Let P(n) be the statement "7 divides $(2^{3n} - 1)$". What is P(n + 1) ?

Sol. P(n + 1) is the statement "7 divides $(2^{3(n+1)} - 1)$"

Clearly P(n + 1) is obtained by replacing n by (n + 1) in P(n).

Ex.5 If w is an imaginary cube root of unity then value of the expression

$1.(2 - w).(2 - w^2) + 2.(3 - w).(3 - w^2) + \ldots\ldots + (n - 1)(n - w)(n - w^2)$ is-

Sol. Sum $= \sum_{n=2}^{n}(n-1)(n-\omega)(n-\omega^2) = \sum_{n=1}^{n}(n-1)\left[n^2 - n(\omega+\omega^2)+\omega^3\right]$

[Q when n = 1, sum = 0]

$= \Sigma(n - 1)(n^2 + n + 1)$

$= \Sigma(n^3 - 1) = \Sigma n^3 - \Sigma 1 = n^2(n + 1)^2 - n$

Ex.6 If x and y are any two distinct integers, then prove by mathematical induction that $(x^n - y^n)$ is divisible by $(x - y)$ for all $n \in N$.

Sol. Let P(n) be the statement given by

$P(n) : (x^n - y^n)$ is divisible by $(x - y)$

Step-I $P(1) : (x^1 - y^1)$ is divisible by $(x - y)$

$\because x^1 - y^1 = (x - y)$ is divisible by $(x - y)$

P(1) is true

Step-II Let P(m) be true, then

$(x^m - y^m)$ is divisible by $(x - y)$

$\Rightarrow (x^m - y^m) = l(x - y)$ for some $\lambda \in Z$ .....(i)

We shall now show that P(m + 1) is true. For this it is sufficient to show that $(x^{m+1} - y^{m+1})$ is divisible by $(x - y)$.

Now $x^{m+1} - y^{m+1} = x^{m+1} - x^m y + x^m y - y^{m+1}$

$= x^m (x - y) + y(x^m - y^m)$

$= x^m (x - y) + yl(x - y)$ [Using (i)]

$= (x - y)(x^m + yl)$ which is divisible by $(x - y)$

So P(m + 1) is true

thus P(m) is true $\Rightarrow$ P(m + 1) is true

Hence by the principle of mathematical induction P(n) is true for all $n \in N$

i.e. $(x^n - y^n)$ is divisible by $(x - y)$ for all $n \in N$

Ex.7 Prove by the principle of mathematical induction that $n < 2^n$ for all $n \in N$.

Sol. Let P(n) be the statement given by $P(n) : n < 2^n$

Step-I $P(1) : 1 < 2^1$

$\because 1 < 2^1$

P(1) is true

Step-II Let P(m) be true, then $m < 2^m$

we shall now show that P (m + 1) is true for which we will have to prove that

$(m + 1) < 2^{m + 1}$

Now P(m) is true

$\Rightarrow \quad m < 2^m$

$\Rightarrow \quad 2m < 2.2^m$

$\Rightarrow \quad 2m < 2^{m+1}$

$\Rightarrow \quad (m + m) < 2^{m + 1}$

$\Rightarrow \quad m + 1 \le m + m < 2^{m + 1}$ $\quad [\because 1 \le m \;\therefore\; m + 1 \le m + m]$

$\Rightarrow \quad (m + 1) < 2^{m + 1}$

$\Rightarrow \quad P(m + 1)$ is true

thus P(m) is true $\Rightarrow$ P(m + 1) is true

So by the principle of mathematical induction P(n) is true for all $n \in N$ i.e. $n < 2^n$

for all $n \in N$
