

Some People Think That the Government Should Strictly Control the Supply of Fresh Water

Some people think that the government should strictly control the supply of fresh water, as the resources are limited, while others think we can use as much water as we want. Discuss both sides and give your opinion.

Sample Answer of Some People Think That the Government Should Strictly Control the Supply of Fresh Water

There has always been the most issue over the uses of water. It is all good that there must be rigid control of Management oversupplying freshwater; due to limited resources, while others consider people can use water accordingly. In my perspective, due to limited resources, control over the usage of water is mandatory, as posterity will not be able to see natural resources of water, as well as human survival is impossible without water.

To commence with, it is suggested that the regime must have control over the usage of water. It is owing to the burgeoning population. To elaborate, the population is soaring, and there is a need for as much water as the population is. So if there is no control over it, people will not get adequate water to drink, and they will die. Moreover, overconsumption of water for domestic chores such as washing cars or gardens, the floor of the house, and name but a few, can create a water crisis. So above mentioned reasons make it mandatory to have control of the government on the utility of water. If the government imposed a heavy penalty, people would not use wastewater. They will endeavour to assist the government by making salty water able to drink by filtering it.

On the other hand, people argue that it is their right to use water according to their desire. They think they pay a water bill. Hence, they can use it for any purpose. Moreover, they consider through the filtration process that rainwater can be used, so it is the state's responsibility to provide them with basic need at any cost. Moreover, another strong argument explains that people get fresh water for a few hours a day, so it sometimes seems impossible to do all household chores. So, there is a need of using freshwater, and people must not be stopped using it.

In conclusion, in consideration of the above analysis, it is ostensible that to save humanity and wildlife, it is essential to curb on supplying freshwater due to scarcity of natural source. In this way, future generation would be able to see the traditional ways of getting water, and marine life can be saved.
