Addition and Subtraction as Inverse Process

Addition and subtraction are inverse operations, which means addition undoes subtraction and subtraction undoes addition. We can rearrange the numbers given in the addition equation and then we can use the addition equation to get two different subtraction equations.

For example: 14 + 9 = 23

The two subtraction equations formed are: 23 - 9 = 14 and 23 - 14 = 9.

Similarly, we can rearrange the numbers that are given in the subtraction equation and then we can make two addition equations.
