

Non-Biodegradable Wastes

 Those wastes which cannot be destroyed naturally are called as Non-biodegradable waste, eg. plastic. Because of their harmful effects the biodegradable and non-biodegradable waste is always disposed separately. They remain for a long time. So they block our natural cycle.

 These days government is taking a lot step for cleaning environment. Blue and Green Dustbins are used to segregate two different kinds of wastes. Green one is for biodegradable waste and blue colored dustbin is non biodegradable waste. In municipalities, Blue colored bins are used for collecting materials that are recyclable.
