

Nesting

Different types of birds make different nests. They use tiny pieces of woods, rope, stems, and threads to make their nest. Mostly they make their nest on a safe place to protect their babies from enemies and weather.

Their nests are made up of grass, thin twigs, dry leaves, bits of tree bark, and pieces of cloth rags. Birds normally make their nests to lay their eggs in them. Then they hatch the eggs, raise the chicks and when the chicks learn to fly, they leave the nest. They make nests only to lay eggs.
