

## Water Cycle

The water cycle describes the continuous movement of water on above and below the surface of the earth. During this process, water changes its state from one phase to another but the total number of water particles remains the same.

The cycle of processes where water circulates between the oceans, atmosphere, and land is called the water cycle. This cycle consists of evaporation, condensation, and precipitation. The complete water cycle is carried into four stages which are as follows:

Evaporation, Condensation, Precipitation and Collection. This is the initial stage of the water cycle. The process by which water from its liquid state changes to vapor, a gaseous state, is termed as evaporation.
