

Electrical and Mechanical Energy

It is used in our homes and many other places. Electrical Energy is generated from water, coal and gas. It runs the washing machine, geyser and many other appliances in our house. Trains also run by electric energy.

Mechanical energy is the energy of either an object in motion or the energy that is stored in objects by their position. For example wind or flowing water.

The energy which is stored in any matter in chemical form is called as chemical energy. It can be obtained by burning coal, wood etc.
