

Natural Fuels

Natural Fuels

Fossil fuels are buried flammable deposits of organic substances such as dead plants and animals that got deposited under several thousand feet of soil. They are also known as non-renewable sources of energy as it takes a very long time for it to replenish.

Fuels such as coal, oil, gas or petrol are also other sources of energy. They have energy stored in them. This energy can be released by burning them. It is used to run machines, cars, cooking and many other things. However, burning of fuels also pollute the air.

Natural Gas
