Clean Drinking Water

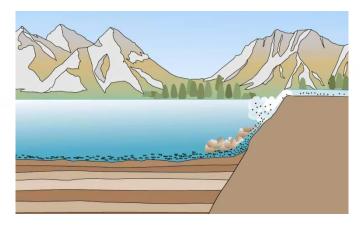

The water which is used for drinking purpose is called as clean drinking water. It is very necessary to ensure that the water is clean and pure for drinking without impurities. Impurities in water can be of two types. Those that are dissolved and those that are not dissolved. Flowing water has many impurities such as mud, germs, minerals, sand etc.

A. Sedimentation-

Sedimentation is a process of settling down of the heavier particles present in a liquid mixture.

B. Decantation

Decantation is the process of separation of liquid from solid and other immiscible liquids, by removing the liquid layer at the top from the layer of solid or liquid below.
