

## Gravitational Force

Gravitational force is the force of attraction on a body by the earth. Example: Leaves and fruits fall from a tree downwards or towards the ground due to the gravitational pull. Earth applies a pull to all objects which is called gravitational force. We can walk and stay on the ground only because of the gravitational force of the earth.

Gravity or gravitational forces are the forces of attraction. It's like the Earth pulling on you and keeping you on the ground. That pull is gravity at work.
