

Screw and Inclined Plane

Screw Jack

It is used to join two things together. In Screw and Jack there is a nail which is having a spiral shape and interlocks two surfaces after which they cannot be separated easily.

It hold things through the threads into which it divides the force and it is different from nail. Screw can also be a screw jack that mechanic used to lift cars up.

Screw and Inclined Plane

An inclined plane is a ramp that assists moving heavy objects up and down heights. It is a plane surface set at an angle, other than a right angle, against a horizontal surface.

A ramp, or inclined plane, is a simple machine with a slanted surface. It helps people and things move between higher and lower places. It takes a lot of force to lift and move something heavy, but it's much easier to push it up a ramp.
