

Stars and Sun

As we all know about stars and sun. We see them in the sky daily. A star is a big ball of hot gases. It gives us heat and light.

Sun is also a big star. It is the nearest star to earth. This is the reason that it appears big as compared to the other stars.

Sun is the main source of light and heat. Sun is very important without the sun we cannot imagine life on the earth. We can see many patterns of the stars in the sky. These patterns are called constellations.

Stars are the part of a huge cloud called the **galaxy**.

There are several galaxies in the universe. Our solar system is a part of the galaxy called the **Milky Way**.
