

## Exterior Angle of a Triangle

If a side of a triangle is produced, the exterior angle so formed is equal to the sum of two interior opposite angles.

Given: In the given figure, the side BC of  $\triangle ABC$  is extended.

To prove: The exterior angle  $\angle ACX$  so formed is the sum of measures of  $\angle ABC$  and  $\angle CAB$ .

Proof:  $\angle 3$  and  $\angle 4$  form a linear pair since they represent the adjacent angles on a straight line.

Thus,  $\angle 3 + \angle 4 = 180^\circ$  .....(2)

Also, from the angle sum property, it follows that:

$\angle 3 + \angle 1 + \angle 2 = 180^\circ$  .....(3)

From equation (2) and (3) it follows that:

$\angle 4 = \angle 1 + \angle 2$

Hence,  $\angle ACX = \angle BAC + \angle CBA$

**Let us understand with an example:**

**Example:** In the figure, two of the angles have measures  $60^\circ$  and  $70^\circ$ . Find the measures of  $\angle XYT$ .

**Solution:** In  $\triangle XYZ$ ,  $\angle XYT$  is an exterior angle at Y.

$$\begin{aligned}\text{So, } \angle XYT &= \angle YXZ + \angle XZY \\ &= 60^\circ + 70^\circ = 130^\circ\end{aligned}$$

$$\text{Thus, } \angle XYT = 130^\circ$$
