

# OUR ENVIRONMENT

# 1 CHAPTER

## CONTENTS

**Introduction**

**Definition of Environment**

**The Lithosphere**

**The Atmosphere**

**The Ecosystem**

**Meaning of environment**

**The Natural Environment**

**The Hydrosphere**

**The Biosphere**

**The Environment**

### ➤ INTRODUCTION

The word 'environment' stands for the **surroundings**, which include all the living and nonliving things around us. The environment provides us with the **air** we breathe, the **water** we drink, the **food** we eat, the **clothes** we wear and the **land** on which we live. The **animals** and **plants** are also part of our environment. Thus, our environment is a combination of both natural and human components or the natural environment and the **human** environment.

### ➤ MEANING OF ENVIRONMENT

Environment is originated from French word *environer* which means neighborhood. Environment is our basic life support system.

### ➤ DEFINITION OF ENVIRONMENT

The place, people, things and nature that surround any living organism is called **environment**. It is a combination of natural and human made phenomena. While the natural environment refers to both biotic and abiotic conditions existing on the earth, human environment reveals the activities, creations and interactions among human beings.

### ➤ THE NATURAL ENVIRONMENT

The natural environment has both **biotic** or living and **abiotic** or nonliving components existing on the earth. The biotic components include plants, animals and human beings, while the abiotic components include land, water and air. The natural environment is also known as the habitat of the organisms. The biotic and the abiotic components of the natural environment are interrelated and there is a constant interaction between them. Actually, the components of the natural environment are dynamic in nature. If there is a change in one component of the natural environment, it will create a change in the other.

The components of the natural environment, such as land, water, air, plants, animals and human beings are called the **domains** or **realms** of our earth. The four realms are as under.

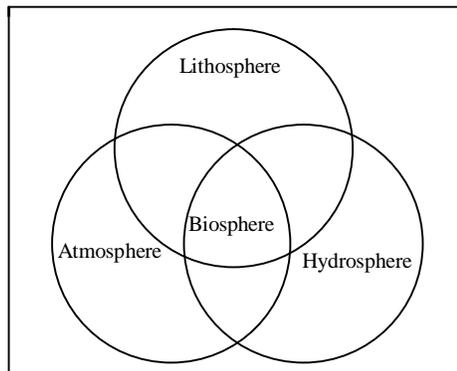

- The **Lithosphere** – the solid crust of the earth.
- The **Hydrosphere** – the waterbodies on the earth.
- The **Atmosphere** – the envelope of air around the earth.
- The **Biosphere** – the living world.

### ➤ THE LITHOSPHERE

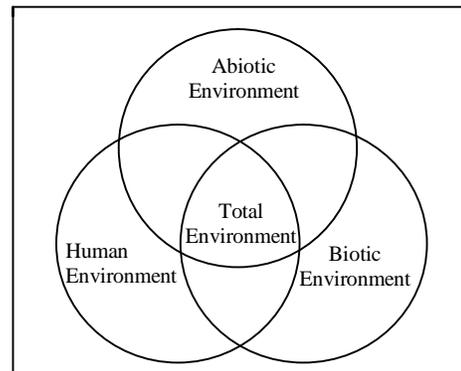

The Greek word '**lithos**' stands for rocks. **Lithosphere** is the outer skin of the earth or the **crust**. This hard and solid layer is made up of rocks and minerals. The upper layer is covered with a thin layer of soil. This rocky sphere extends both over continents and ocean basins. Its surface is not uniform and has a variety of landforms, such as mountains, plateaus, ridges, plains, valleys, waterfalls, etc. These landforms are also found on the ocean floors. Most of the human needs are met from the lithosphere. It provides land for agriculture and settlement. The land is covered with forests and grasslands. A large variety of minerals is found in the crust of the earth which are needed for the development of industries.

### ➤ THE HYDROSPHERE

The word '**hydro**' stands for water. About 71 percent of the total surface area of the earth is covered with water, which is called **hydrosphere**. The water on earth is found in oceans, seas, bays, gulfs, rivers, lakes, ponds etc. The earth is the only planet in the solar system, which has enough water. Thus, the earth is also called the **Blue planet**. Water is found in solid, liquid and gaseous forms at the same time. The fresh water is provided on the earth through the **Water cycle or the Hydrological Cycle**. Life cannot survive on the earth's surface without water. Thus, it is essential for all living organisms. Fresh water is in great demand for domestic needs, agriculture and industries. Water is also used to generate hydroelectricity.

Domains of the Earth

Domains of the Earth

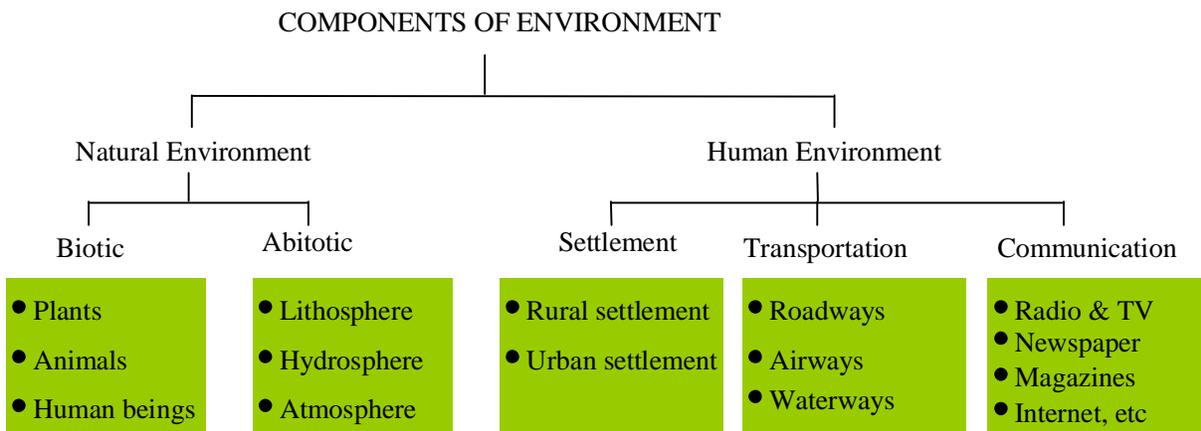

### ➤ THE ATMOSPHERE

The ocean of air which surrounds the earth from all sides is called the **atmosphere**. The gravitational pull of the earth holds the atmosphere around it. About 99 percent of the total mass of air lies within 32 km from the earth. Air is a mixture of gases (Nitrogen, Oxygen, Carbon dioxide, Ozone, Helium, Hydrogen, etc.), water vapour and dust particles. The atmosphere protects us from harmful radiations and scorching heat of the Sun. The air is vital for all forms of life on the earth. The condition of the atmosphere with respect to the

temperature of air, atmospheric pressure, humidity, etc. makes up the weather of a place. The changes in the atmosphere can produce changes in the weather and climate of a place.

## ➤ THE BIOSPHERE

The lithosphere, hydrosphere and atmosphere (land, water and air) are made up of nonliving matter, while Biosphere is a sphere of living organisms. It is found where lithosphere, hydrosphere and atmosphere meet and interact with each other to support life. It is a narrow zone, about 24 km in thickness, which extends a little above and below the surface of land and in water and air. The existence of biosphere has made the earth a unique planet in the solar system. The living organisms in the biosphere vary greatly in size and shape. The variety of life on earth is called **biodiversity**. The living organisms in the biosphere can be classified into the **plant kingdom** and the **animal kingdom**.

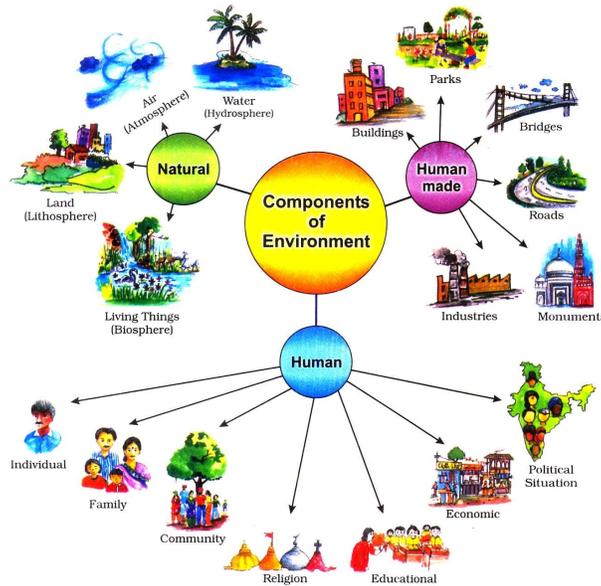

## ➤ THE ECOSYSTEM

All the living organisms, i.e., plants, animals and human beings, depend on their immediate environment. They are also interdependent on each other. The relationship between the living organisms, as well as the relationship between the organisms and their surroundings form an **ecosystem**. The ecosystem has no particular size. It can be as large as a rainforest, grassland, desert, ocean, mountain or as small as a water pond or a small lake. Ecosystem can be natural or artificial. Sun is the main source of energy for the growth and development of an ecosystem. **Ecology** is the science which studies the relationship between the living organisms and their environment.

## ➤ HUMAN ENVIRONMENT

- Human beings interact with the environment and modify it according to their need. Early humans adapted themselves to the natural surroundings. They led a simple life and fulfilled their requirements from the nature around them. With time needs grew and became more varied. Humans learn new ways to use and change environment.

- They learn to grow crops, domesticate animals and lead a settled life. The wheel was invented, surplus food was produced, barter system emerged, trade started and commerce developed Industrial revolution enabled large scale production. Transportation became faster.
- Information revolution made communication easier and speedy across the world.
- A perfect balance is necessary between the natural and human environment. Humans must learn to live and use their environment in a harmonious way.

**[Components of Environment]**
