

Night Time Sky

What is the Night Time Sky?

The sky at night is called the night-time sky.

It looks dark because the sun has set.

What Do We See in the Night Time Sky?

The Moon

- The moon comes out at night.
- It shines with light from the sun.
- Sometimes it looks round (full moon) and sometimes half or thin.

Stars

- The stars twinkle in the night sky.
- They are tiny lights far away.
- There are millions of stars in the sky.

Planets and Shooting Stars

- Sometimes we can see planets that shine like stars.
- Shooting stars are quick flashes of light in the sky.

Owl and Bats

- Some animals like owls and bats come out at night.
- You might see them flying in the night sky.

Quick Recap Table:

Thing in Night Sky	What It Does
Moon	Shines at night
Stars	Twinkle in the dark sky
Planets	Look like big stars
Shooting Stars	Flash of light that moves fast
Owl / Bat	Animals active at night

Fun Fact:

- The moon changes shape every few days!
- We cannot see stars in the day because of the sun's brightness.
